Nonparametric Statistics - Portland State University

Nonparametric Statistics The term "parametric" is intended to refer to statistical tests that make assumptions about particular population parameters (eg, equal variances in two groups in the population) or use particular distributions for making statistical decisions (eg, use of the -tdistribution) The term "nonparametric" is

Parametric and Nonparametric: Demystifying the Terms

term "nonparametric" but may not have understood what it means Parametric and nonparametric are two broad classifications of statistical

procedures The Handbook of Nonparametric Statistics 1 from 1962 (p 2) says: "A precise and universally acceptable definition of the term 'nonparametric' is not presently available

NONPARAMETRIC IDENTIFICATION

nonparametric identification was recognized as an important first step in the econometric analysis of even parametric models Establishing that a function or distribution is nonparametrically identified within a set of non-parametric functions or distributions implies its identification within any subset of the set of non-parametric functions

NONPARAMETRIC STATISTICS* I. Richard Savage

Thus, in nonparametric analysis, the parameters are transformed in an obvious manner--possibly remaining constant--when the scales of measurement are changed The distinction between parametric and nonparametric is not always clearcut Problems involving the binomial distribution are parametric (the functional form

ESTIMATION OF SEMIPARAMETRIC MODELS*

hazards model, the nonparametric methods described in the Hardle and Linton chapter are more appropriate) In a typical parametric model, the parameters of interest, m_0 , appear only in a structural equation analogue to (II), while the

Nonparametric Methods

"Handbook of Parametric and Nonparametric Statistical Procedures" CRC Press, New York, 1997 Volume II: page 237 CHAPTER VI; SECTION B: GRAPHICAL METHODS Purpose of Graphical Methods: Graphical methods can be thought of as a way to obtain a "first look" at a group of data It does

A Distribution-Free Theory of Nonparametric Regression

The first nonparametric regression estimate of local averaging type was proposed by J W Tukey in 1947 The partitioning regression estimate he introduced, by analogy to the classical partitioning (histogram) density estimate, can be regarded as a special least squares estimate Some aspects of nonparametric estimation had already appeared

LARGE SAMPLE SIEVE ESTIMATION OF SEMI ...

Handbook of Econometrics, Volume 6B estimate the parametric and nonparametric parts in semi-nonparametric models, typically with optimal convergence rates for both parts This chapter describes estimation of semi-nonparametric econometric models via the method of sieves We present some general results on the large sample properties of the

Understanding Statistical Tests

NONPARAMETRIC TESTS If the data do not meet the criteria for a parametric test (normally distributed, equal variance, and continuous), it must be analyzed with a nonparametric test. If a nonparametric test is required, more data will be needed to make the same conclusion. For this reason, categorical data are often converted to
